Different plants Different «propolis types»

Red: *Dalbergia spp.* (Brazil, Mexico, Cuba)

Clusia: *Clusia spp.* (Cuba, Venezuela)

Pacific: *Macaranga tanarius* (Indonesia, Taiwan, Okinawa)

Mediterranean: Cupressaceae (Greece, Sicily, Malta)

Propolis gathering

50-100 grams per year

Uses of propolis by bees

- to create an aseptic environment
- to smooth out and coat the internal walls and parts of the beehive
- to make the entrance of the hive weathertight
- to build a protective barrier against the enemies narrowing the entrance
- to seal cracks and crevices
- to strengthen the thin borders of combs
- to embalm the carcasses of dead hive invaders

Uses of propolis
for human health purposes
properties and activities

- Antibacterial properties
- Antifungal properties
- Antiviral properties

- Anti-inflammatory
- Antioxidant
- Antiulcer
- Hepatoprotective
- Cytotoxic
- Immunostimulating
- …

Propolis composition

Propolis type	Geographic origin	Plant source	Main constituents
Poplar	Europe, North America, non-tropic regions of Asia, New Zealand	*Populus* spp. (*Aigeiros, P. nigra L.*)	**Flavones, Flavonones, cinnamic acids and their esters**
Green	Brazil	*Baccharis dracunculifolia*	**Prenylated, p-coumaric acid, diterpenic acids**
Birch	Russia	*Betula verrucosa*	**Flavones, flavonols**
Red	Brazil, Cuba, Mexico	*Dalbergia ecastophyllum*	**Isoflavonoids (isoflavans and pterocarpans)**
Mediterranean	Sicily, Greece, Malta, Crete	Cupressaceae	**Diterpenes (mainly acids of labdane type)**
Clusia	Cuba, Venezuela	*Clusia* spp.	**Polyprenylated and benzophenones**
Pacific	**Okinawa, Taiwan, Indonesia**	***Macaranga tanarius***	**C-prenil-flavonones**

Survey on Italian propolis

The aim was to:

- assess the main physical-chemical characteristics and the active components that characterize Italian propolis
- evaluate whether, as reported by the studies done up to today, Italian propolis belongs to the group **"Poplar type"**
- Expand the database for the characteristics of the Italian production for classification models of propolis types.

Survey on Italian propolis

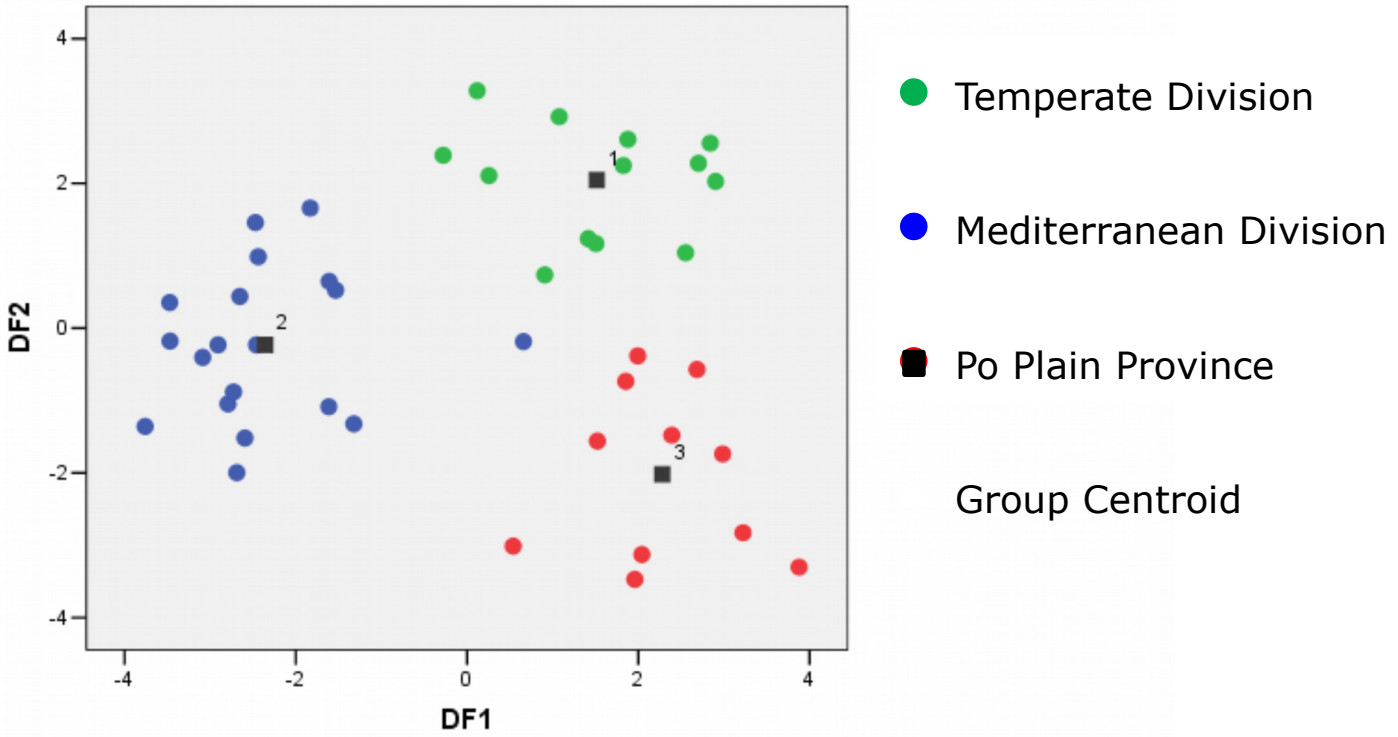
GDA analysis – supervised multivariate analysis



The DF1 explains 65.8% of the total variance.
The cross-validation shows a predictive capacity of 79.8%.
The DFs are particularly correlated with the signals of kaempferol, apigenin and caffeic acid for DF1 and chrysin, galangin and ferulic acid for DF2.

Survey on Italian propolis

Conclusion

- Most of the analysed Italian propolis samples satisfied the proposed quality requirements for the “poplar type” proposed by Popova et al. (2007)…
- … but some of the samples (from Sicily and Sardinia) have shown a low or very low value in flavonoid content and do not comply with “poplar type”. Mediterranean type?
- A more detailed and careful statistical analysis comprehensive of all Italian samples showed that it was possible to distinguish three different groups corresponding to the mapped ecoregions of Italy as was reported recently by Blasi et al.(2014).
- Standardization of Italian propolis is needed to ensure a real evaluation of the product.
